

Email Security As A Service

Anti Spam as it should be done.

The Email Laundry has been the leading developer of new technology for the email security industry for some time. Our Cloud based service is renowned for accuracy and resilience.

The service is provided through our global network of data centres with strict security protocols in place for local data protection law.

In its pre-DATA filtering, The Email Laundry blocks more spam than several solutions do overall. During the content scanning phase, more than two-thirds of the remaining spam was blocked. This combined with the fact that there wasn't a single false positive gave a final score of 99.87% (Virus Bulletin Anti Spam testing)

The Email Laundry Email Security Service

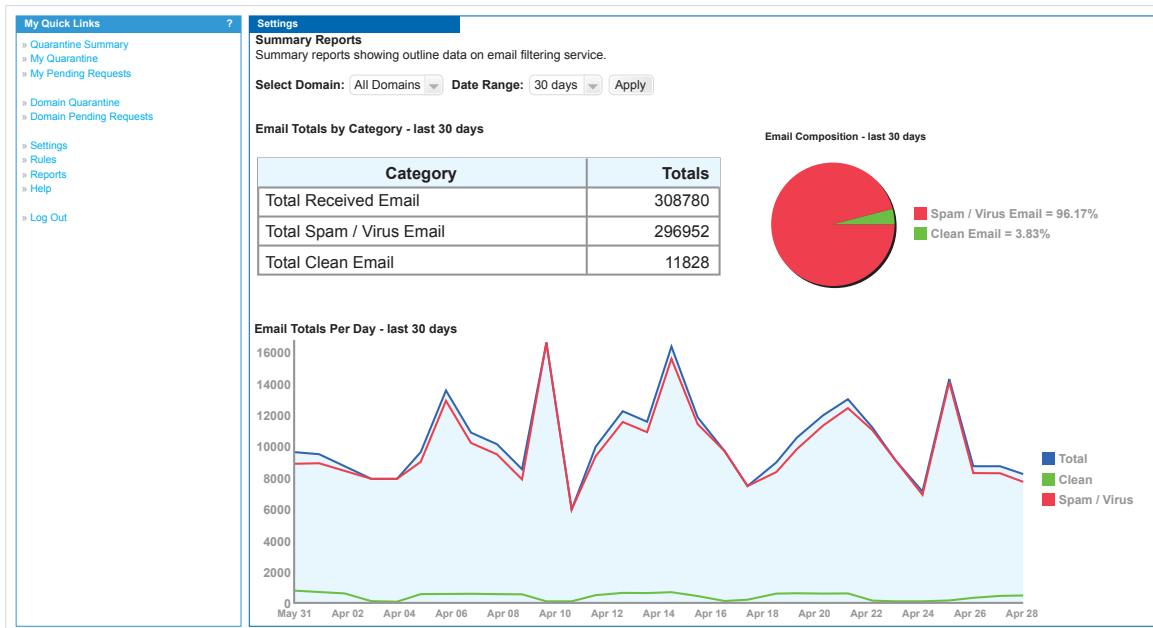

- Over 99.5% spam capture and zero false positives
- Automatic updates promote 24/7 anti spam accuracy
- Manages spam away from your network, saves bandwidth usage by up to 90%
- Protects productivity by reducing time wasted by users filtering messages
- Stops all known viruses
- Low administration footprint
- Zero end user disruption
- Protection from Denial of Service attacks
- No hardware, no software, no maintenance, no hassle
- The world leader in reputation based filtering

Organisational Control

The customer decides how to control the service. End user or administrator quarantine digest? The customer chooses. Wish to create white or black lists or import them from your old service? Of course you can.

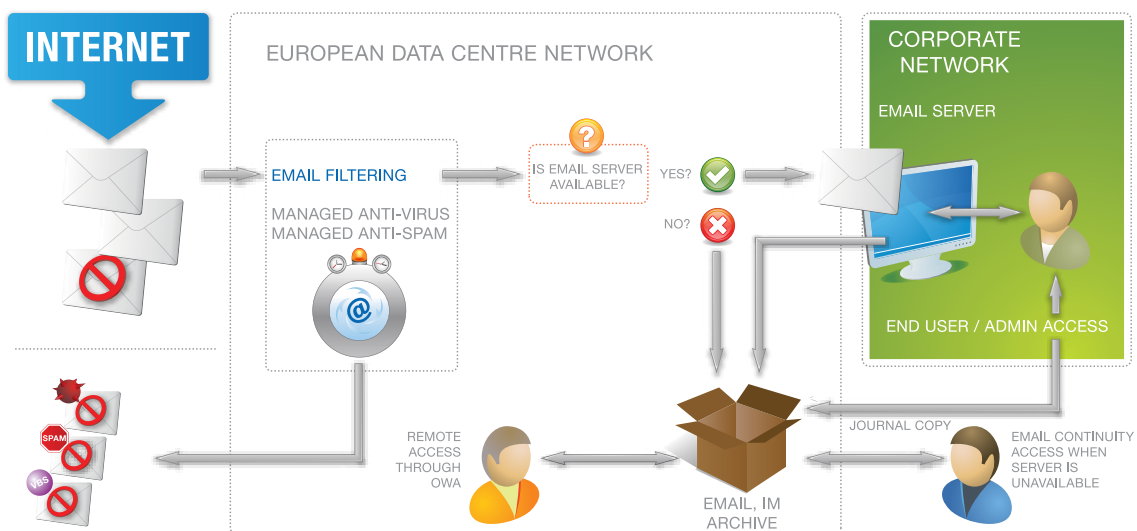

How the service works

<p>Reputation Level 1</p>	<p>Before the email is sent to The Email Laundry the sending machine will ask to connect. During this initial phase called the SMTP handshake, The Email Laundry's world leading algorithms determine whether the connection is a genuine email server or just more internet "noise". If it's just noise the customer doesn't need to see the traffic and the connection is dropped. The logs are retained on the service for reference.</p>
<p>Anti Virus Level 2</p>	<p>Each email is then scanned through multiple anti virus engines. These engines are continually changing to take advantage of the best performing engine.</p>
<p>Content Level 3</p>	<p>Every email goes through a range of filters examining different aspects of the content of the email data. These include examining embedded URL's for linking to malicious sites, examining our own spam fingerprinting service against our spam traps, examining header and body content for obvious "spammer" give aways.</p>
<p>User Content Level 4</p>	<p>The customer has a number of options to determine what is blocked such as blocking sound, video or executable files. The customer can also implement white and black lists. This is all set up in a customer web interface.</p>

Additional services

- Continuity. An emergency webmail service, or a connection to the archive, can be provided in case of company disaster
- Outgoing. An outgoing filtering service to protect your email reputation
- Disclaimers – Company disclaimers can be added to each outgoing email
- Email archiving is also available as an additional integrated service
